Not illustrated. 1736 Excerpt: ...as with the former; and so on in infinitum. The Quo tient therefore Is  $j \dots + \dots$ , &c. (or  $j$  into  $i - I + j i - j i$ , &c.) So that by this Operation the Number or Quantity  $j q$ , (or  $1 x - f - x_I$ ) is reduced from that Scale in. Arithmetick whose Root is  $b + x$ , to an equivalent Number, the Root of whose Scale, (or whose converging quantity) is. And this Number, or infinite Series thus found, will converge so much the faster to the truth, as  $b$  is greater than  $x$ . To apply this, by way of illustration, to an instance or two in common Numbers. Suppose we had the Fraction  $f$ , and would reduce it from the septenary Scale, in which it now appears, to an equivalent Series, that shall converge by the Powers of 6. Then we shall have  $j = \dots$  and therefore in the foregoing general Fraction  $j$ , make  $a = r$ ,  $\text{£} = 6$ , and  $x = i$ , and the Series will become  $f \dots f. 1 \dots \pm t$  Sec. which will be equivalent to 7. Or if we would reduce it to a Series converging by the Powers of 8, because  $f = -f$ , make  $a = 5$ ,  $b = 8$ , and  $v = -1$ , then then  $f = r + \dots - t - p + \dots + g$  tec. which Series will converge faster than the former. Or if we would reduce it to the common Denary. (or Decimal.) Scale, because  $i = -T$ , make  $t a i j e i o$ , and  $X \dots -3 \gg t$  "en  $T = = T7$  "4" Too "+" TooJ H Too o o' "+" To oTTTJT C« s= o, 1428, &c. as may be easily collected. And hence we may observe, that this or any other Fraction may be reduced a great variety of ways to infinite Series; but that Series will converge fastest to the truth, in which  $b$  shall be greatest in respect os  $x$ . But that Series will be most easily reduced to the common Arithmetick, which converges by the Powers of 10, or its Multiples. If we should here resolve 7 into the parts 3-4-4, or 2+-5, or 1-f-,6, &c. instead of conv...
